

Data viz ideas for the survey results page

1. **Category demand ranking — horizontal bar chart.** Which of the 14 life areas people picked as pain points, ranked. Money/investing/insurance leads at 225 selections, then Groceries (165), Fitness (138), Shopping (123). This is your headline chart — it answers "where does the pain concentrate?" at a glance.
2. **The three emotions — donut or stacked bar.** Every pain point is tagged Frustrating, Procrastinate, or Repetitive. Overall split: Frustrating 602, Procrastinate 385, Repetitive 308. Simple, and it establishes the vocabulary the rest of the page uses.
3. **Emotion × category heatmap.** The richest single visual. Each cell = how many people felt a given emotion about a given category. The pattern is striking and worth showing: Groceries is *repetitive* (78) not frustrating; Fitness and Learning are *procrastination* traps (76, 56); Money splits across all three; Getting-around and Travel are almost purely *frustrating*. This tells builders not just *what* to fix but *what kind* of fix each category needs.
4. **The 2×2 — how many picked (x) vs how frustrating (y).** A scatter/quadrant plotting each category by popularity against its frustration share. Surfaces the "niche but painful" quadrant — Weddings is picked rarely (38) but rated very frustrating, so it sits alone in the low-volume/high-pain corner. Good for spotting underserved opportunities.
5. **"Time" word cloud / top-terms bar.** Pulled from the ~1,300 free-text stories. "time" is the runaway most-frequent word (263), followed by find, different, order, same, multiple — the language of choice-overload and repetition. A word cloud is eye-catching; a top-15 bar is more honest. Either makes the qualitative data feel alive.
6. **How people cope today — bar chart of current "systems."** From the "what system have you adopted" answers: apps 368 mentions, but *nothing at all* 202, family 103, chats 73, friends 63, Excel 25. The "nothing / duct-tape" share is the real opportunity signal — show it prominently.
7. **Age distribution + age × category.** A histogram of respondents plus a small-multiples or grouped bar showing how category choice shifts young → old. Test the "young avoid, old are trapped" hypothesis. Caveat: the age field has junk (a "937", a 12) — clean it and quote the **median 33**, not the mean.
8. **Geographic reach — map or bar.** Respondents skew tier-1: Mumbai 99, Bangalore+Bengaluru 114, Delhi 35, Hyderabad 28, Chennai 23. A simple India map with dot sizes, or a city bar chart, frames who this sample represents (and its limits).
9. **Story length as an intensity signal — small comparison bar.** Frustration and procrastination stories run longer (avg ~31 words) than repetitive ones (~28). A modest chart, but it visually argues that emotional pain makes people write more — a nice bridge between the quantitative and qualitative sections.
10. **Pilot opt-in — single stat callout.** Not a chart, a big number: **81% (379/469) said "count me in"** to test solutions. Great closing tile to convert readers/teams.

A few notes so the page holds together: ideas 1–4 are your core (demand, emotion, the cross of the two, and the opportunity map); 5–6 add the "why" from free text; 7–10 are context and framing. If you want, I can generate any of these directly from the CSV as chart images or an

interactive artifact for the site — the heatmap (#3) and the 2×2 (#4) are the two most worth building custom. Which should I start with?
